

5/18/2023

The alarm clock that I bought and dissected has bright, but very small LCDs. About 2.8 x 1 mm. Very different from the usual 3 to 5 mm dome shaped LCDs. These are attached directly to the surface of the PCB, not through pinholes, and soldered on the other side.

I prefer this type, but don't think that I could attach them manually. It seems that too much precision is necessary. Can this type of PCB be easily ordered? I need to understand this a bit more.
